

Q-Level shifts the aggregate inside the panel geometry

(grey: individual CDFs; blue: fixed BC at $q = 0.5$; pink: learned Q-Level; shading: 95% parameter-uncertainty band for $\hat{G}_t(k)$)

Low-dispersion quarter
2018:Q4, $D_t = 0.122$, $n = 31$ forecasters

High-dispersion quarter
2022:Q1, $D_t = 0.994$, $n = 27$ forecasters
